

# MikroTik WAN Static

Using WinBox

IP > Address > Add static IP from ISP and assign to the WAN Interface (probably ether1)

IP > DNS > Settings > Add DNS from ISP

This is the bit I spend a while trying to acheive...

IP > Route > Add 0.0.0.0/0 and Gateway IP from ISP

IP > DHCPClient > Dissable/Remove the DHCP client on WAN Interface (Ether1)

Not needed for the above but a tip for the Firewall (how to add an IP rule / 'port forward all ports'):

IP > FW > Filter Rules > + > General > Chain > Input → SrcAdd (IP adress that want want to allow in)  
> Protocol > 6(TCP)

When the rule is created, MAKE SURE THE RULE IS SHIFTED ABOVE the deny rule
